

Practical Exam: Sales Cloud Pipeline Forecasting & Auditing Utility

Business Scenario

The Sales Operations team requires an automated data audit interface to manage open pipeline deals that are scheduled to close during this current calendar month, but have not yet advanced to formal pricing or negotiation reviews.

Reps need a custom control tab to identify these deals at a glance and automatically calculate a custom projected revenue forecast based on specific risk and tier thresholds.

Functional Requirements & UI Features

Students must build a single Lightning Web Component (LWC) and a corresponding Apex controller that implements the following behavior:

1. Custom Salesforce Schema Pre-Requisite

Before writing any code, students must manually create one custom field via Object Manager:

- **Object:** *Opportunity*
- **Data Type:** *Currency*
- **Field Label:** *Expected Revenue Overridden*
- **Field Name / API Name:** *Expected_Revenue_Overridden__c*

2. The Opportunity Layout Custom Tab (LWC Interface)

- The component must be exposed to the **Opportunity Record Page** layout canvas.
- Students must add a custom tab to the page layout named **"Forecast Manager"** inside the Lightning App Builder and embed this component inside it.
- **The Related List Display:** The tab must display a clean, sequential row listing of all Opportunities that pass these exact backend evaluation criteria:

1. The Opportunity *CloseDate* must fall within **this current calendar month** (*THIS_MONTH*).
 2. The Opportunity *StageName* must **NOT** be one of the following advanced or closed states: '*Proposal/Price Quote*', '*Negotiation/Review*', '*Closed Won*', or '*Closed Lost*'.
- **Row Fields to Display:** Each deal block must explicitly show the record's *Name*, *Amount*, *Probability*, and your custom *Expected_Revenue_Overridden__c* field.

3. The One-Click Audit Action Button & Calculation Logic

Next to each individual Opportunity record row, add an action button labeled **"Set Expected Revenue"**. Clicking this button must call an imperative Apex transaction that evaluates the specific record fields and updates the custom field directly:

- **Tier 1 (High Volume / High Probability):** If the opportunity *Amount* is greater than \$2,000,000 **AND** its *Probability* is greater than 50%, calculate and set the *Expected_Revenue_Overridden__c* field to exactly **15% of the Amount** value.
- **Tier 2 (Baseline Deals):** For all other remaining records that do not meet the Tier 1 conditions, calculate and set the *Expected_Revenue_Overridden__c* field to exactly **10% of the Amount** value.

4. Toast Notifications & Workspace Navigation Redirection

Once the database transaction resolves successfully:

1. Fire a standard green **success toast notification box** to confirm the update on screen.
2. Clear the local data cache (*refreshApex*) to update the field values on layout refresh.
3. Automatically execute a platform **navigation redirection to route the user completely back to the standard Opportunity Object Home workspace panel view**.
